

Test Task: "App Icon Fetcher" Microservice

Background

For our internal team needs, we require a simple tool to automate asset retrieval. Managers frequently provide us with mobile app `Bundle IDs` (e.g., `com.zhiliaobaoapp.musically`), and we need a way to quickly fetch links to the highest resolution icons for these apps from both the **Apple App Store** and **Google Play**.

Your Task: Develop an MVP (a microservice, a script, or a simple web page) that takes a Bundle ID as input and returns the icon URLs from both stores.

Note: You are free to use any programming language and technology stack you are comfortable with (preferably the ones listed in your CV).

MVP Requirements

- **Input:** A string containing the Bundle ID.
- **Output:** A user-friendly or system-friendly response. This can be a JSON API response (containing `apple_icon_url` and `google_icon_url`), a CLI output, or a basic HTML form displaying the two images. Choose the format you can implement the fastest.
- **Error Handling:** An app might exist in one store but be missing in the other. Your solution should not crash; it must clearly indicate if an icon could not be found.

Technical Requirements

- **Docker is highly expected:** Since you can choose any tech stack, please include a `Dockerfile` (and ideally a `docker-compose.yml`) so we can run and test your MVP with a single command without installing local dependencies.
- Include a short `README.md` with clear launch instructions and a mention of how much time you spent on the task.

What We Evaluate

- **Result > Architecture:** We need a working tool that solves the immediate problem. Speed of delivering a functional MVP is our top priority. Don't hesitate to use third-party libraries or efficient parsing methods.
- **Decomposition & Autonomy:** We want to see how you research and overcome obstacles independently (e.g., handling the lack of a public API for Google Play).
- **AI Usage:** Using AI tools (ChatGPT, GitHub Copilot, Claude, etc.) is **highly recommended**. We value engineers who leverage modern tools to ship code faster and more efficiently.

How to Submit: Please provide a link to your **GitHub repository**.
